Title: Expedition Earth Trailer

Creator: Centre for Astrophysics and Supercomputing

Year: 2021

Audio/video for this transcript available from: <https://youtu.be/f4gC8YoLcJE>

The night sky, for as long as we have looked up, it has fascinated us.

To our ancestors it was even more, they discovered patterns in the stars, using them as a guide for their way of life.

As they watched the sky over many nights they noticed something else, some of those brightest objects did not follow the same path as the rest of the stars.

Future astronomers would reveal that these mysterious objects are planets and that we live on one called Earth.

Our planet supports and sustains life, but what about the others? Is there is other life out there in the Universe?

Could there be another planet out there like our own? So begins a new quest for astronomers, welcome to expedition Earth.
